

TOOON.

CEMENTING PROCESS

Production according to a Swiss method

The tabletop of our cemented TST Table is **cut from wood**. This material ensures that the weight remains limited and that the finished table does **not feel cold**, unlike a real stone or ceramic table.

On the wooden base, **three layers of “cement” a mix of quartz sand, cement, and water** are applied. To give the table a unique color, a smooth texture, and a sleek look, three layers of this cement mixture are always required. Each layer is applied by hand in our own workshop in Hoboken.

At **TOOON.**, we pursue the highest quality which also means striving for a scratch- and stain-resistant table. For this purpose, after the cementing process, the table is finished with at least **three layers of a two-component PU coating**. This coating forms a protective film that prevents stains and scratches from occurring.

WHY CHOOSE TOOON. ?

The cementing mix we use at **TOOON.** contains water, cement, but also quartz sand. This has a positive impact on the look and feel, quality and durability of the end result. The mix we use daily in our Swiss cementing process is different from the processes and materials used by our competitors.

There are some notable differences, which may or may not be more pronounced depending on the composition.

PROPERTY	QUARTZ SAND	MORTEX	LIME
Scratch-resistant	Yes	No	No
Stain-resistant	Yes	To a lesser extent	To a lesser extent
Available in multiple colors	Yes	Yes	Yes
Biodegradable	Up to 99%	To a lesser extent	To a lesser extent
Heat-resistant	No	No	No
Designed, produced, and processed	Belgium and Netherlands	Mostly Eastern Europe	Mostly Asia
Re-treatment	Not required	Recommended after 2 years	Recommended after 2 years
Original use	Floors	Walls and panels	Construction techniques

EASE OF USE AND MAINTENANCE

Thanks to the hardened PU coating that protects the table, you do not have to worry about possible damage. After all, we have tested this extensively. Stains caused by the following substances can even be removed after 36 hours:

- Coffee
- Lemon
- Red wine
- Ketchup

In addition, the PU coating provides scratch resistance.

Please note: like any coating, this PU coating has its limitations. Be careful with prolonged exposure to hot elements (+65°C), strong detergents (white spirit, paint thinner or bleach) and powders with strong discolouring properties (dye, curry, etc.).

STAIN	PRODUCT	INTERVAL
Daily stains (light)	Water with a microfibre cloth	Daily use
Presistent stains that are several	Microfibre cloth with all-purpose	Weekly use
Stubborn stains you cannot remove with normal soap	Miracle sponge	Only when needed

** miracle sponge will slightly polish off the coating, too persistent use may leave a shiny stain. Still found a stain you can't get out? We can always restore the table to like-new condition. Send a photo and description to: Service@desomer.be and we will be happy to help!
